

To make sure that the seat tube mounted 1x chainguide will fit properly and decide if you need the LOW clamp version or HIGH clamp version :

1. Seat tube diameter must be either dia34.90mm, dia31.80mm or dia28.60mm.
2. The clamping zone must be perfectly cylindrical (for 32T to 36T chainrings). If the low clamp zone isn't suitable check the high clamp zone.
3. The area 35mm in front of seat tube center line at the clamp level must be free of any obstacle (suspension linkage for instance).
4. If the 3 conditions above aren't satisfied consider if possible using instead the BB mounted 1x chainguide, ISCG or ISCG05 1x chainguide.
